SOFTWARE RADIO TECHNOLOGY PLC

TETRA handset receives approval

The Directors of Software Radio Technology plc (“SRT” or the “Company”), the AIM-quoted provider of digital wireless communications technology and product solutions, are pleased to announce that its new TETRA handset has received its first formal infrastructure interoperability approval.

The approval granted relates to the formal testing and approval which are required from the manufacturers of TETRA networks to prove interoperability. The process is operated by an independent organisation and verifies that the product is able to operate on a given network infrastructure.

At this time, the handset is undergoing a series of multiple formal approvals and its first pre-production run with our chosen contract manufacturer, Flextronics Inc. Production is expected to commence during the second half of this year.

In 2007, the Company announced that it would be developing its own TETRA (OEM white label) handset utilising its own core technology solution. This marked an evolution of the Company’s traditional license-revenue based business model within the framework of remaining an enabler of a global network of local suppliers of TETRA products under their own local brands. The initiative leverages the existing core technology solution to generate increased revenues from wider market segments.

Simon Tucker, Group Managing Director said, “Of course we already had the core technology, however our team have done an excellent job in taking this project from an exciting idea last year into the complete, high quality, and now approved, product that it is today. Although we were confident that the handset would obtain the relevant approvals, it’s always a big milestone when the first is secured.’

George Kyrios, SRT PMR Technology Ltd, Managing Director said, “Our market research showed that users wanted differentiation and greater choice, and a segment of the market had specific requirements not met by other products. We believe our handset meets these requirements and, when combined with our business model, will steadily gain market share.’
