Press Release

Monday 26th May 2008

The world's lowest cost, full feature TETRA handset to be available from 2009

SRT PMR Technology Limited announced today that it is developing a technology platform that will enable the availability of TETRA handsets at prices below \$400 each.

The technology is already well under development and the first prototype PCB will unveiled at the TWC in Hong Kong (Stand A3) along with a model of one of the ultra low cost TC-200 OEM handsets scheduled for production in 2009.

SRT PMR Technology Managing Director, Dr George Kyprios, said: "As with all similar markets, we believe that a significant reduction in handset prices will facilitate a much larger volume and aggregate value market. Buyers' budgets will go further and those who could not previously consider TETRA due to price will now be able to enjoy its benefits. Having perfected our current solution, which is now being used in several handsets, we have invested considerable time and effort in determining how we can achieve significant cost reductions whilst maintaining full compliance with all the required ETSI and operational specs. This starts with the technology platform and we believe that our new advanced platform will provide the basis for a pricing revolution in the TETRA market in the future, benefiting both users and the industry as a whole."

SRT PMR Technology has a complete in-house development team who are experts in digital PMR technologies. This has enabled the company to develop all its own technology including firmware (DSP, Protocol Stack and MMI), hardware (Base Band and RF ICs) and various Tools to support it such as production test systems, MMI Customisation and Field Programmers. The development and field deployment of this technology in multiple handsets across the world has given SRT a deep and unique understanding of TETRA. This accumulated experience is now enabling the company to develop its revolutionary next generation TETRA handset platform.

The technology platform will be available in a variety of flexible formats to maximise the availability of low cost options for feature rich, reliable TETRA handsets to users through: technology transfer licenses, PCA modules and complete white label OEM handsets.
